Sum of Net_Revenue_USD and Sum of ...

I started this project by finding a dataset of FMCG (Fast-Moving Consumer Goods) companies from **2023 to 2025**.

After acquiring this dataset I was tempting to drive right into the analysis phase of the the project. However, I took the time to look at my data in Power Bi table view to get a better understanding of the dataset that I was working with and to take the necessary cleaning steps. Messy Data IN = Messy Analysis Out

Although relatively clean, I quickly realized that I was work with a large spread of data containing many attributes (columns). So, as another preliminary step I decided that I needed to roughly define the parameters of this project; giving my actions more direction and intention. My initial goals were :

DEFINE

- What products generate the most revenue?
- Overall Sales performance
 - Revenue over time
 - Top products
 - Top brands
 - Sales channel
 - Top product type

First, I narrowed the view of this project even further to touch more on Financial Performance and Top Line Growth. Meaning Total Revenue was the important attribute to look at.

I made clustered bar charts to look at Total revenue in terms of leading brands and product category. I made a card showing the Total Revenue of the entire company. A pie chart to show Total Revenue by Sales Channel. Furthermore, two column charts, one depicting Change in Total Revenue over time and the other depicting a Percent Difference in Total Revenue over time. These visuals were accompanied by three slicers giving users the ability to change the visuals based on year, brand, and or sales channel.

From these visuals I was able to determine the following insights: Total Revenue from 2023 (the start of the dataset) increased by 422,972.83 (that is a 9.21% increase from 2023). This made me curious about how the brands performed over the same time period. Again, I only looked at the top 5 brands, but what I found was garnered more questions. Like "how did the 4th highest brand of 2023 (HomeNest) become the highest earning brand of 2025?" or "How did FuelCore and RoastTrail (the top 2 highest earning brands) drop to third and fifth place, respectively?" And "Does marketing spending have any influence on these statistics?".

With these new question, I redefine the purpose and direction of my analysis.

After redefining my focus, I determined that the best course of action would be to look at total marketing spending by brand and sales channel over time, and also the average amount of units each sales channel sold. As expected wholesale sells by far the most units (507 compared to the second highest sales channel (distributor) which only sold about 325).

Moreover, the Total marketing over time chart shows an increase in market spending by HomeNest and a decrease in market spending by FuelCore and RoastTrail. Total Revenue and Total Market Spending seems to correlate with one another, but I wanted see how strong that correlation was. This lead me to make a scatter chart comparing Total Market Spending and Total Revenue and also finding the correlation coefficient between the two. A very strong positive correlation coefficient of .97 suggested that these to variable are closely related.

There seems to be a problem, the brand that spent the most on marketing (PureLife) did not bring in the most Revenue. This can be explained by looking at how this brand used its Marketing spend compared to other brands. PureLife only allocated 24.8% of its Total Market spending to the Wholesale channel, whereas HomeNest allocated 29.5%. This suggests that channel strategy is as important as spend volume.
